### Supplementary Figures and Legends

**Figure S1. Flow chart of tribological evaluations for regenerative cartilage.**

**Figure S2. Study design and different treatments of B/BME-MFX, B-MFX and Defect groups. (A and B) Surgery design and cartilage repair schematic diagram in the different groups: blue square with white stripes showed the Bio-Gide scaffold, black arrows indicated the exudation direction of the bone marrow blood after the microfracture, red globules stood for the MSCs in the bone marrow blood from the microfracture, yellow triangles represented the MSCs obtained from the bone marrow enrichment technique.**

**Figure S3. ICRS II scoring evaluation of the regenerative cartilage in B/BME-MFX (n=28), B-MFX (n=26), Defect (n=12), Sham (n=12) groups after a 24-week treatment, including items of overall assessment (A), surface/superficial assessment (B), and surface architecture (C) (\* $P < 0.05$ , respectively).**

**Figure S4. ICRS II scoring evaluation of the regenerative cartilage in B/BME-MFX (n=28), B-MFX (n=26), Defect (n=12), Sham (n=12) groups after a 24-week treatment, including items of Tissue morphology (A), Matrix staining (B), Cell morphology (C), Chondrocyte clustering (D), Formation of a tidemark (E), and Basal**

integration **(F)** ( $*P < 0.05$ , respectively).

**Figure S5. ICRS II scoring evaluation of the regenerative cartilage in B/BME-MFX (n=28), B-MFX (n=26), Defect (n=12), Sham (n=12) groups after a 24-week treatment**, including items of Subchondral bone abnormalities/marrow fibrosis **(A)**, Inflammation **(B)**, Abnormal calcification/ossification **(C)**, Vascularization **(D)**, and Mid/deep zone assessment **(E)** ( $*P < 0.05$ , respectively).

**Figure S6. Biomechanical assessments of the regenerative cartilage.** **(A)** Representative images of the surface elasticity measurement among the B/BME-MFX, B-MFX and Sham groups by using AFM and Young's modulus topography. Both the surface Young's modulus **(B)** and overall compression modulus **(C)** of the B/BME-MFX repairs were closer to the Sham group, and higher than the B-MFX group ( $*P < 0.05$ ).

# Figure S1

Regenerative  
Cartilage

The first step : Initial Tribological Performance

Initial Repair Tissue Appearance

Histological Assessment

Initial COF

Roughness Measurement

PRG4 expression

PRG4 surface continuity

Ex-vivo Million-cycle wear test

Real-time COF Recording

The second step : Terminal Tribological Performance

Terminal Repair Tissue Appearance

Roughness Measurement

Terminal COF

Weight Loss ( $\Delta W$ )

Volume Loss ( $\Delta V$ )

Another Potential Clinical Hazard Evaluation

Cartilage Wear Particle Analyses
