

1 **Supplementary materials and methods**

2 **Patient samples**

3 Informed consent acquired by all patients who fulfilled criteria for ALF and control individuals. The controls  
4 were adjacent normal liver tissues harvested from patients underwent surgery for liver cancer. The  
5 experimental design and study were approved by the Institutional Ethical Committee. Detail information  
6 about ALF patients were shown in Table S1.

7

8 **Aminotransferases analysis**

9 Plasma alanine aminotransferase (ALT) was assessed using commercial kits (Nanjing Jiancheng  
10 Bioengineering Institute) according to manufacturer's instructions.

11

12 **Histological analysis**

13 Mice livers were fixed in 10% formalin (Biosharp), then stained with hematoxylin and eosin. For  
14 immunohistochemistry experiment, CD11b antibody (Abcam) was used according to standard protocol.  
15 The terminal deoxynucleotidyl transferase-mediated deoxyuridine triphosphate nick end-labeling (TUNEL)  
16 assay was used to assess cells apoptosis with a commercial kit (KeyGene) according to the  
17 manufacturer's protocol.

18

19 **Hepatic macrophage isolation**

20 The hepatic macrophage isolation was described previously [1-2]. In brief, mice livers were collected,  
21 minced, and digested with collagenase type IV (Sigma-Aldrich), Pronase E (Solarbio) and DNase I  
22 (Sigma-Aldrich) at 37 °C for 20 min, followed by centrifuging at 800g for 5 min at 4 °C, and then discard

23 the supernatant carefully. Resuspend cell pellet with ice-cold PBS (BSA 0.5%). Then centrifuge at 800g  
24 for 5 min at 4 °C. Resuspend the cells pellet in 6 ml of 40% Percoll (sigma-Aldrich) and pipet the cell  
25 suspension on 2 ml of 80% Percoll (sigma-Aldrich). The nonparenchymal cell population were isolated by  
26 centrifuging at 800g for 30 min at 4 °C without brake. The harvest cell ring was collected and cultured in  
27 RPMI-1640 supplemented with 20% FBS and 1% Penicillin-Streptomycin solution. After 2 h, the adherent  
28 cells were collected for experiments.

29

### 30 **Murine bone marrow-derived macrophage immortalization**

31 Bone marrow-derived macrophages (BMDMs) were harvested after growth from bone marrow progenitor  
32 cells obtained from femurs and tibias of male C57BL/6J mice. MSCF (Macrophage Colony Stimulating  
33 Factor, Recombinant Mouse M-CSF Protein, 416-ML-050, RnDsystems, 20 ng/ml) was used to select  
34 macrophages. Cells were cultured with DMEM medium coupled with 10% fetal bovine serum and 1%  
35 Penicillin-Streptomycin at 37 °C incubator. For LPS/ATP challenge, differentiated BMDMs were cultured  
36 for 24 h first. Then macrophages were primed with 500 ng/ml LPS for 2 h to activate Nlrp3 inflammasome  
37 as well as its downstream pathway, and incubated with 50 mM ATP (Adenosine 5'-triphosphate disodium  
38 salt solution, A6559-25UMO, Sigma) for another 30 min with the purpose of secreting IL-1 $\beta$ . For SSII  
39 treatment, the macrophages were co-incubated with SSII (5  $\mu$ g/ml) and LPS (500 ng/ml) for 2 h, whereas  
40 the control group was treated with a same concentration of DMSO.

41

### 42 **ASC detection**

43 After primed with LPS for 2 h and ATP for 30 min, BMDMs, seeded on petri dish, fixed with 4%  
44 paraformaldehyde (PFA) for 15 min at room temperature and washed with DPBS three times. A

45 permeabilization procedure and a block process are followed. Then cells were incubated with anti-ASC  
46 antibody (sc-514414, Santa Cruz) overnight at 4 °C in a final dilution of 1:200. For quantification of ASC,  
47 six to ten random fields were selected and the relative mean immunofluorescence intensity was  
48 measured using Image J.

49

#### 50 **Transfection of small interfering RNA**

51 Cells were fasted by serum-free medium. Then BMDMs were transfected with nonspecific control siRNA  
52 or mouse YB-1 siRNA nucleotide fragment (GenePharma) using the Lipofectamin<sup>TM</sup> RNAiMAX  
53 (Invitrogen) for 36 h. Target primer sequences for RNAi knockdown of mouse YB-1 (Gene ID: 22608):  
54 (5'-3') CCACGCAAUUACCAGCAAATT (sense) and (5'-3') UUUGCUGGUAUUUGCGUGGTT (antisense).  
55 Negative control (NC) primer sequences: (5'-3') UUCUCCGAACGUGUCACGUTT (sense) and (5'-3')  
56 ACGUGACACGUUCGGAGAATT (antisense). YB-1 phosphor-mimetic mutant plasmid (Ser<sup>102</sup> to Glu<sup>102</sup>)  
57 was designed commercially (Genemei Biotech, Guangzhou).

58

#### 59 **Dual-Luciferase Reporter Gene System**

60 For Nlrp3 promoter study, Raw264.7 were cultured in 24-well plates ( $2.5 \times 10^5$ /well) and transfected with  
61 0.375 µg each of pGL3-promoter reporter plasmid (Genemei Biotech, Guangzhou) or equivalent amounts  
62 of empty pGL3-basic plasmid and 37.5 ng TK plasmid. Meanwhile, Raw264.7 cells were co-transfected  
63 with 0.375 µg pcDNA3.1-YB-1 expression plasmid or empty pcDNA3.1 vector. After cell transfection for  
64 36 h, followed by LPS challenge for 2 h, Raw264.7 cells were lysed and the supernatant was evaluated  
65 for luciferase activity using the Dual-Luciferase Reporter Assay System (Promega) according to the  
66 manufacturer's instructions.

67

68 **ChIP-seq analysis**

69 Raw264.7 cells were cultured in 15 cm dish and treated with or without LPS for 2 h. Then cells were fixed  
70 with formaldehyde. The chromatin from Raw264.7 cells was digested into 150-900 bp DNA/protein  
71 fragments by using SimpleChIP® Plus Enzymatic Chromatin IP Kit (9500, CST) according to the  
72 manufacturer's instructions. And the immunoprecipitation was employed by using p-YB-1 antibody (2900,  
73 CST). After purification, the precipitated DNA and input DNA was analyzed by sequencing.

74

75 **Immunofluorescence staining**

76 BMDMs placed on a petri dish were stimulated with LPS. Liver macrophages were placed on a microslide.  
77 After the dewaxing procedure, the sections were soaking with 1×modified sodium citrate antigen repair  
78 solution (Beyotime, P0083). Then the samples were incubated in microwave on high (100%) for 5 min,  
79 heat (40%) for 5 min, followed by a ceasefire for 3 min, and the samples were cooled to room temperature.  
80 Then after the fixation in 4% Paraformaldehyde (PFA) for 15 min at room temperature, the samples were  
81 gently lavaged with PBS every 5 min three times. After permeabilization with 0.1% Triton X-100 solution  
82 for 5-10 min, the samples were blocked with DPBS containing 3% BSA for 1 h. Excess buffer was drained,  
83 and the tissue sections were washed three times by DPBS. The coverslip was placed to allow a certain  
84 amount of p-YB-1 antibody (bs-3477R-AF594, Bioss) to disperse over the entire section and the samples  
85 were incubated in a moist chamber overnight at 4°C. For counterstaining, DAPI staining was performed  
86 for 5 min at room temperature, and then washed slides three times. The images were captured with Zen  
87 software for LSM 880 laser Airscanning microscope. Relative mean fluorescence was analyzed with Fiji  
88 image J software, randomly greater than or equal to 5 views of each petri dish or section were selected to

89 conduct the quantitative analysis. For human samples, greater than or equal to 5 fields of per slice were  
90 selected to calculate the average of the ratio of CD64/p-YB-1 double-stained positive cells to the total  
91 number of cells.

92

### 93 **Immunoblot analysis**

94 BMDM cell lysates were soaked in ice-cold RIPA buffer in the presence of PMSF and the Halt™  
95 Phosphatase Inhibitor Single-Use Cocktail (Halt™ Protease Inhibitor Cocktail, Thermo). Equivalent  
96 proteins in each lane were electrophoretically separated by SDS-polyacrylamide gel electrophoresis  
97 (PAGE), transferred to nitrocellulose membranes, and blotted with the following primary antibodies: Nlrp3  
98 (15101S, CST), Caspase-1 (AG-20B-0042-C100, AdipoGen), IL-1β (31202S, CST), p-YB-1 (A8481,  
99 Assay Biotech), YB-1 (4202S, CST), and β-actin (3700S, CST), p-AKT (4060, CST), AKT (2920, CST).

100

### 101 **Metagenomics analysis**

102 Cecal content DNA of PBS or LPS/GalN treated group (n=3) were mixed and metagenomics analysis was  
103 performed as previously described [3-4]. In brief, the microbial DNA was randomly fragmented followed  
104 by end repair and A tailing, adapter ligation, post-ligation cleanup, library amplification and  
105 post-amplification cleanup. The DNA sample was sequenced using the Illumina/MiSeq sequencing  
106 platform and then raw data acquisition by base calling. In order to improve the quality of information  
107 analysis, the raw data filtering was conducted with Trimmomatic v0.36. The CAZy (Carbohydrate-Active  
108 enZYmes Database) analysis was used for gene ontology.

109

### 110 **Cytokine ELISA**

111 IL-1 $\beta$  protein levels were determined by commercial kit (Neobioscience) based on manufacturer's  
112 instructions.

113

#### 114 **Quantitative real-time PCR analysis**

115 Following RNA extraction from cells or liver using Trizol agent according to the manufacturer's instructions,  
116 a reverse transcription (RT) procedure was performed to synthesize complementary DNA (cDNA) using a  
117 reverse transcription kit (TOYOBO). Then real-time polymerase chain reaction (PCR) quantification was  
118 performed using SYBR® Green Realtime PCR Master Mix (TOYOBO). All primers are listed in  
119 Supplementary Table 2. The  $2^{(-\Delta\Delta C(T))}$  was used to analyze the relative quantification and 18S was used to  
120 normalize expression data.

121

#### 122 **Statistical analysis**

123 The data were presented as mean  $\pm$  standard error of the mean (SEM). The two-tailed Student's t-test  
124 was used. The significance level was  $p < 0.05$ .
