# Decreased neuronal excitability in medial prefrontal cortex during morphine withdrawal is associated with enhanced SK channel activity and upregulation of small GTPase Rac1 

## Supplemental Information

Supplementary Methods and Materials<br>Supplementary Figures S1-S3<br>Supplementary Table S1-S3<br>Supplementary References

## Supplementary Methods and Materials

## Animals

Male Sprague Dawley rats (200-250 g) were acquired from the Animal Care Committee of the Fourth Military Medical University (FMMU). All procedures were conducted in compliant with the guidelines of the National Institutes of Health and the FMMU Animal Care and Use Committee, and this study was approved by the institutional ethical committee of Tangdu hospital, FMMU. All rats were housed in conventional open top cages with food and water available ad libitum under 12 hours light/dark cycle (lights on 8:00 a.m.) and constant temperature $22 \pm 1^{\circ} \mathrm{C}$ and humidity $55 \pm 10 \%$. All behavioral studies were performed between 9:00 a.m -11:00 a.m, and following every test, the apparatus was thoroughly cleaned with $20 \% \mathrm{v} / \mathrm{v}$ ethanol and dried to remove odor cues. Before initiating the conditioned place preference (CPP) pre-test animals were allowed to accustom to the laboratory conditions for 7 days.

## Drugs

Morphine was acquired from Shenyang No. 1 Medical Drugs Company (Shenyang, China) and saline was obtained from Disai Biological Pharmaceutical Company (Xi'an, China). Saline ( $0.9 \%$ ) or morphine ( $10 \mathrm{mg} \cdot \mathrm{kg}^{-1}$ ) administrations were injected subcutaneously for 7 consecutive days followed by one-week withdrawal.

## Conditioned place preference procedure

All behavioral experiments were performed at 9 a.m -11 a.m during the light phase of the cycle. Methods for CPP were adapted from published procedures [1]. Rats were trained in the standard device (Noldus Information Technology Co., Ltd, Netherlands) consisting of two equally sized chambers and a smaller center chamber. The Behavior
was also recorded through a roof-camera using ETHOVISION 3.1 software (Noldus Information Technology Co., Ltd, Netherlands). The CPP score represents the time in the morphine treatment-paired compartment during the testing phase minus that during the preconditioning phase.

## Brain slice preparation and ex-vivo electrophysiology

The patch clamping method used was based on a previous protocol, with certain modifications [1, 2]. Rats from saline mock-treatment control (SC) groups or morphine withdrawal groups were sedated by intraperitoneal (i.p.) injection with pentobarbital sodium ( $40 \mathrm{mg} \cdot \mathrm{kg}^{-1}$, Cat.\# P11011, Merck, Germany) and then decapitated. Brains were quickly separated and immersed in ice-cold $\left(0-3^{\circ} \mathrm{C}\right)$ slicing solution, which contains (in mM): 225 Sucrose; $119 \mathrm{NaCl}, 2.5 \mathrm{KCl}, 4.9 \mathrm{MgCl}_{2}, 0.1$ $\mathrm{CaCl}_{2}, 26.2 \mathrm{NaHCO}_{3}, 1.0 \mathrm{NaH}_{2} \mathrm{PO}_{4}, 1.25$ glucose; 1 ascorbic acid; and 3 kynurenic acid. Coronal slices $(250-300 \mu \mathrm{~m})$ containing the NAc or mPFC were cut in the same solution [3]. The slices were recovered at $32^{\circ} \mathrm{C}$ in carbogen-bubbled $\left(95 \% \mathrm{O}_{2}, 5 \%\right.$ $\mathrm{CO}_{2}$ ) ACSF, containing (in mM ): $126 \mathrm{NaCl}, 2.5 \mathrm{KCl}, 1.2 \mathrm{MgCl}_{2}, 2.4 \mathrm{CaCl}_{2}, 18$ $\mathrm{NaHCO}_{3}, 1.2 \mathrm{NaH}_{2} \mathrm{PO}_{4}, 11$ glucose ( $\mathrm{pH} 7.2-7.4,301-305 \mathrm{mOsm}$ ). During our experiments, the slices were immersed and continuously perfused with warmed carbogen-bubbled ACSF ( $32^{\circ} \mathrm{C}$ ), while picrotoxin ( $50 \mu \mathrm{M}$; Sigma, USA) and CNQX ( $10 \mu \mathrm{M}$; Sigma, USA) were applied to block GABA-receptors and AMPA-type glutamate receptors. Our trials were focused to the GABAergic median spiny projection neurons, which accounts more than $90 \%$ of the efferent neurons within the NAc core and shell, while other cells could be separated easily by features of a large soma or very high firing rates and larger AHPs [4-6].

Whole-cell recordings were achieved for mPFC pyramidal neurons and NAc MSNs with the guidance of differential interference contrast microscopy (BX51WI; Olympus, Japan) and a CCD camera (Olympus, Japan). Borosilicate glass micropipettes ( $3-5 \mathrm{M} \Omega$ ) were prepared by a P-97 horizontal micropipette puller (Axon Instr., USA). The intracellular solution used in whole-cell voltage and current clamp recordings contained (in mM ): $130 \mathrm{KOH}, 2.8 \mathrm{NaCl}, 17 \mathrm{HCl}, 20$ HEPES, 105 methane sulfonic acid, 0.3 EGTA, 2.5 MgATP, 0.25 GTP ( pH 7.2-7.4, 275-285 mOsm). EGTA was incorporated in the pipette solution to maintain calcium-dependent potassium currents during recordings [2]. To measure firing, we applied current pulses by a patch amplifier in current clamp mode, and applied a sequence of 7-8 current pulses ( 300 ms duration, 20 pA apart) for every 30 seconds. The minimum current amplitude was attuned for each neuron, in order to make the first pulse just under the spike firing threshold. The resting membrane potential was set to -90 mV before analysis of firing. For SK current measurement, neurons were held at -70 mV , then depolarized for 400 ms to steps ranging from -40 to -10 mV (with 10 mV between steps) prior to being brought back to -70 mV . The SK tail current was observed upon returning to -70 mV . Depolarizing pulses were combined with a 33.3 pA hyperpolarizing pulse to test the input resistance. We utilized the anterior commissure, the lateral ventricles and the dorsal striatum as landmarks for locating the position of the NAc shell, NAc core,
prelimbic cortex and infralimbic cortex for the patch clamping. The shape of NAc shell is ring-like in coronal section. The distance between NAc shell to AC is about 4 $\mathrm{mm}-13 \mathrm{~mm}$. The NAc shell or layer 5 pyramidal cells located in the infralimbic subregion of the mPFC were visually recognized by using an upright infrared differential interference contrast microscope (BX51WI; Olympus, Japan).

## Primary neuronal cultures

E18 pregnant Sprague-Dawley female rats were prepared for primary cortical cultures as previously described [7]. Briefly, embryos were obtained from the rats and then placed into Hank's Balanced Salt Solution (HBSS) (Cat. \#14025134, Invitrogen, USA)-HEPES ( 10 mM ; Cat.\# H4034, Sigma, USA) solution. Prefrontal cortex was dissected from the embryos and incubated in $0.25 \%$ trypsin (Cat. \#15400054, Invitrogen, USA) for 25 min at $37^{\circ} \mathrm{C}$ with tapping every 5 min . Prefrontal cortex were washed for three times with HBSS-HEPES, and triturated with a fire-polished Pasteur pipette. Tissues were dissociated after 10-20 trituration, and neurons were immediately plated in pre-equilibrated dishes or plates coated with $1 \mathrm{mg} \cdot \mathrm{ml}^{-1}$ poly-1-lysine (P2636, Sigma, USA) in plating medium. The plating medium consisted of Neurobasal medium (Cat. \#21103049, Gibco, USA) supplemented with $2 \%$ FBS, 2\% B-27 (Cat. \#17504044, Gibco, USA), 2\% glutamax (Cat. \# 35050-061, Gibco, USA), and $2 \%$ penicillin-streptomycin (Cat. \#15140122, Gibco, USA). The neurons were incubated at $37^{\circ} \mathrm{C}$ in a humidified $5 \% \mathrm{CO}_{2}$ atmosphere, and primary culture medium was changed every 3 days or 4 days.

## Brain stereotaxic injection of TMR into NAc for retrograde tract-tracing

All surgical procedures for 11 rats were deeply anesthetized with pentobarbital sodium (i.p., $40 \mathrm{mg} \cdot \mathrm{kg}^{-1}$, Cat. \# P11011, Merck, Germany). The anesthetized rats were placed onto a stereotaxic frame (NARISHIGE, Tokyo, Japan). According to the stereotaxic coordinates in the stereotaxic atlas of Paxinos and Watson (2007), $0.05 \mu \mathrm{l}$ of $10 \%$ tetramethylrhodamine-dextran (TMR, D3308, 3,000 MW, Molecular Probe, Eugene, OR) dissolved in trisodium citrate solution ( pH 3.0 ) was made stereotaxically into the bilateral NAc core or NAc shell of the rats (NAc core: 1.8 mm anterior to the Bregma, $\pm 1.4 \mathrm{~mm}$ to the midline, and 7.2 mm deep from the brain surface; NAc shell: 1.8 mm posterior to the Bregma, $\pm 0.8 \mathrm{~mm}$ to the midline, and 8.0 mm deep from the brain surface). A glass micropipette (internal tip diameter $15-25 \mu \mathrm{~m}$ ) attached to a 1 $\mu l$ Hamilton microsyringe was used. Each injection was made by pressure over a period of 10 min and the micropipette was left in the place for additional 20 min after the injection.

## Immunohistochemistry

The animals were deeply sedated by intraperitoneal injection ( $40 \mathrm{mg} \cdot \mathrm{kg}^{-1}$ ) of pentobarbital sodium (Cat.\# P11011, Merck, Germany) and transcardially perfused with 100 ml of PBS and $4 \%$ paraformaldehyde (PFA; Sigma-Aldrich, St. Louis, USA). Brain tissues were separated and post-fixed overnight with $4 \%$ PFA at $4^{\circ} \mathrm{C}$, then cut into sections ( $30 \mu \mathrm{~m}$ ) using a vibratome (VT1000S; Leica, Wetzlar,

Germany). Sections were washed in 0.1 M phosphate buffer prepared for TMR and NeuN immunostaining. The slices were incubated in PBS with $0.2 \%$ Triton X-100 (10 min ), washed with PBS ( $3 \times 5 \mathrm{~min}$ ), blocked in $1 \%$ normal horse serum in 0.1 M phosphate buffer ( 30 min , room temperature), and subsequently incubated overnight at $4^{\circ} \mathrm{C}$ with the following primary antibodies: mouse monoclonal anti-NeuN (Cat.\# MAB377, 1:1000; Millipore, Billerica, United States), rabbit anti-TMR monoclonal antibody (Cat.\# A-6397, 1:400, Invitrogen, United States) in PBS. Following washing in PBS ( $3 \times 5 \mathrm{~min}$ ), Cy2-conjugated anti-mouse IgG (Cat.\# 115-225-071, 1:200, Jackson ImmunoResearch Laboratories, United States) and Cy3-conjugated anti-rabbit IgG (Cat.\# 111-095-003, 1:200, Jackson ImmunoResearch Laboratories, United States) were used for fluorescence detection. Nuclei counterstaining was performed using 4',6-Diamidino-2-phenylindole dihydrochloride (DAPI; Cat.\# D9542, Sigma-Aldrich, United States). Fluorescence images were taken using a confocal microscope (A1; Nikon, Japan).

## Western blotting

The SK2 and SK3 subunits protein expression level was examined in the mPFC, NAc and dorsal striatum during drug withdrawal as described previously [1, 8]. Lysis buffer
( 50 mM Tris- $\mathrm{HCl}, 150 \mathrm{mM} \mathrm{NaCl}, 1 \%$ Triton X-100, $0.5 \%$ sodium deoxycholate, $0.1 \%$ sodium dodecyl sulfate, pH 8.0 ), supplemented with $1 \%$ protease inhibitor cocktail (P8340; Sigma Aldrich, USA). The following antibodies were used: Anti-SK2 C-terminus (Cat.\# APC-045, 1:800, Alomone, Jerusalem, Israel), Anti-SK3 N-terminus (Cat.\# APC-025, 1:800, Alomone, Jerusalem, Israel), Anti-Rac1(Cat.\# ab33186, 1:200, Abcam, United States), Anti-PP2A (Cat.\# SAB4502298, 1:1000, Sigma-Aldrich, United States), Anti-CK2 $\alpha$ (Cat.\# SAB4500514, 1:800, Sigma-Aldrich, United States), Anti-CK2 $\beta$ (Cat.\# SAB4500516, 1:800, Sigma-Aldrich, United States), Anti- $\beta$-actin (1:5000, TA-09; ZSGB-BIO Co., Beijing, China) and Anti- $\beta$-tubulin (Cat.\# SAB4500088, 1:1000, Sigma-Aldrich, United States). After lysing fresh samples in lysis buffer, the protein concentration was determined using a bicinchoninic assay kit (Beyotime, Ltd., Haimen, China) according to the kit manufacturer's protocol. Equal quantities of protein from the NAc, dorsal striatum or mPFC were resolved on $8 \%$ acrylamide SDS-PAGE gels and electrophoretically transferred to PVDF membranes (Millipore, Billerica, MA, USA). The membranes were blocked for 2 hours in $5 \%$ skim milk diluted in PBS/tween (PBST, 0.01 M PBS with $0.1 \%$ Tween 20) at $37{ }^{\circ} \mathrm{C}$ with gentle shaking. The membranes were then incubated overnight with antibodies reactive against the primary antibodies (overnight at $4{ }^{\circ} \mathrm{C}$ in $4 \%$ skim milk). Then, the membranes were incubated with the HRP-conjugated secondary antibodies after PBST washing. Blots were developed with chemiluminescence (Chemi Doc XRS Plus; Bio-Rad, CA, USA). ImageJ 4.0 (National Institutes of Health, Bethesda, MD, USA) was applied to quantify and analysis the band intensity. The expression of SK2, SK3 and Rac1 was normalized to that of $\beta$-actin, the expression of PP2A, CK2 $\alpha$ and CK2 $\beta$ was normalized to that of $\beta$-tubulin.

PP2A activity assay
PP2A activity was measured as previously reported using the PP2A Colorimetric Assay kit (GenMed Scientifics, Woodland, CA, USA) [9]. This assay is based on the release of free phosphate from the dephosphorylation of RKpTIRR by endogenous PP2A, which is detected via chromogenic reaction with molybdenum blue produced by ferrous sulfate reduction. The free phosphate concentration was measured at 660 nm on a spectrophotometer (Bio-Rad). The phosphate concentration ( $\mu \mathrm{M} / \mathrm{L}$ ) was converted to PP2A activity/mg protein as described by the manufacturer.

## LC-MS/MS iTRAQ analysis

The methods of sample preparation for LC-MS/MS iTRAQ analysis were reported in previous study [10, 11]. For the iTRAQ analysis, in each group, fresh mPFC tissues were rapidly dissected from the brains and sampled. To reduce individual variation, 12 SC rats were pooled into 3 samples as saline1, saline2, and saline3, and 12 MW rats were pooled into 3 samples as M1, M2 and M3. The pooled samples were digested according to the FASP procedure and labeled using the 8-plex iTRAQ reagent according to the manufacturer's instructions (Applied Biosystems). The final proteins that were deemed to be differentially expressed were filtered as a $p$ value $<0.05$ and 1.1 -fold changes ( $>1.10$ or $<0.91$ ) relative to the SC group.
Functional classification and Gene Ontology (GO) enrichment analyses of the DEPs were carried out using DAVID (https://david.ncifcrf.gov/). Proteins were classified by GO category (http://www.geneontology.org), including "biological process," "cell component," and "molecular function." The KEGG (http://www.genome.jp/kegg/) database was employed to identify significantly enriched pathways. Rattus norvegicus was selected as the species and the background. The significance was determined with slight modifications as recommended by the authors of DAVID according to the Benjamini-corrected P value $<0.05$. Functional protein association networks were explored in STRING v. 10.5 (http://string-db.org/).

A total of 131 differentially expressed proteins were annotated by GO analysis and were classified into 24 significant GO terms in Biological Process (Supplementary Figure S2A), 17 in Cellular Component (Supplementary Figure S2B), and nine in Molecular Function (Supplementary Figure S2C). Notably, these proteins were found to be enriched in GO terms which associated with potassium channel activity and regulation of Cytoskeletal component (Supplementary Figure S2D).

## Assay for Racl activity

Active Rac1 pull-downs were performed following the active Rac1 Pull-Down and Detection Kit (catalog \#16118, Thermo Scientific ${ }^{\text {TM }}$ ) protocol [12]. Briefly, lysates of the rat mPFC tissue was centrifuged $\left(16,000 \times \mathrm{g}\right.$ at $4^{\circ} \mathrm{C}$ for 15 min$)$, and then the transferred supernatants were added with GTP $\gamma$ S or GDP to incubate at $30^{\circ} \mathrm{C}$ for 15 min. The mixtures were incubated with glutathione resin beads and glutathione

S-transferase-fused Rac1-binding domain of p21-activated kinase (Pak) at $4^{\circ} \mathrm{C}$ for 1 h . The beads and proteins bound to the fusion protein were washed at $4^{\circ} \mathrm{C}$, eluted in SDS sample buffer, and analyzed for bound Rac1 by Western blotting.

## lentivirus construction

In vivo experiments, lentiviruses were generated from Genepharma Technology Co., Ltd (Shanghai, China). Lentivirus plasmid pSicoR was purchased from Addgene, and oligos coding for the various shRNAs were annealed and cloned into HpaI-XhoI-digested pSicoR vectors. The target shRNA regions were chosen as follows: Rac1-124, GCCAATGTTATGGTAGATGGA; Rac1-219, GCAAACAGACGTGTTCTTAAT; Rac1-340, GGGACGAAGCTTGATCTTAGG; negative control, TTCTCCGAACGTGTCACGT.

## Stereotaxic injections of lentivirus into the IL cortex

Animals were deeply anesthetized with an i.p. injection ( $40 \mathrm{mg} \cdot \mathrm{kg}^{-1}$ ) of pentobarbital sodium (Aoxin Chemical Factory, Yangzhou, China). Lentiviruses ( $9 \times 10^{8}$ to $1 \times 10^{9}$ $\mathrm{TU} / \mathrm{ml}$ ) were stereotaxically injected into the IL ( $2.5 \mathrm{~L} /$ site) over 5 min using a glass micropipette (internal tip diameter $15-25 \mu \mathrm{~m}$ ) attached to a $5 \mu \mathrm{l}$ Hamilton microsyringe. The injector was retained in place for another 10 min then withdrawn at $1 \mathrm{~mm} / \mathrm{min}$. We applied the injections bilaterally at the following coordinates (as calculated from bregma and the dura mater): 3.2 mm posterior to the Bregma, $\pm 0.6$ mm to the midline, and 5.0 mm deep from the brain surface.

## Adeno-associated virus (AAV) construction and infection

In vitro experiments, cortical neurons were transfected with AAV-mediated gene delivery as described in [13]. The transductions were performed at 7 DIV and maintained for 12 DIV. The target shRNA regions were chosen as follows: Rac1-124, GCCAATGTTATGGTAGATGGA; Rac1-219, GCAAACAGACGTGTTCTTAAT; Rac1-340, GGGACGAAGCTTGATCTTAGG; negative control, TTCTCCGAACGTGTCACGT. For the rescue plasmid, the shRNA targeting binding sites of rac 1 plasmid were synonymously mutated to prevent the above three shRNAs from interfering with the expression of Rac1. The synonymous mutation sites of rac 1 plasmid are as follows: site-124, GCCAATGTAATGGTCGACGGT; site-219, GCAAACAGATGTATTTTTGAT; site-340, GGGACGAAGCTAGACCTGAGA. The AAV-Rac1 shRNA, AAV-Rac1 rescue and AAV-Ctrl-shRNA of AAV2/9 serotype were packaged by Genepharma Technology Co., Ltd (Shanghai, China). shRNA plasmid pSicoR was purchased from Addgene, and oligos coding for the various shRNAs were annealed and cloned into HpaI-XhoI-digested pSicoR vectors. Viral titers over $1 \times 10^{12}$ genomic particles $/ \mathrm{mL}$ were used. The cells were transduced with AAVs at a multiplicity of infection (MOI) of $10^{4}$ viral genome copies per cell (VGC/cell) for 3 h at $37^{\circ} \mathrm{C}$. The media were subsequently completed with B27-supplemented Neurobasal medium.

The assessment of locomotor sensitization

The locomotor activity of each rat was measured 45 min using locomotor activity cage (Noldus Information Technology Co., Ltd, Netherlands) as described previously [14]. Morphine withdrawal responses (such as wet dog shakes) and locomotor activity were simultaneously observed for the same duration. Other withdrawal symptoms (such as the number of fecal pellets, ptosis and diarrhea) were not included here.

## Statistical analysis

pClamp 10.2 (Axon Instr., USA) and Origin 9.0 (Origin Lab, Northampton, MA, USA) were applied for analyzing results of ex-vivo electrophysiological recordings. Considering varied number of neurons recorded for each rat, we averaged the baseline spike firing and voltage clamp parameters (baseline input/output slope, action potential and input resistance parameters, tail currents, etc.) for all neurons achieved from a given animal, and acquired a specific value of each of these parameters for each individual rat. The data were expressed as means $\pm$ SEM for all the tests. All statistics were presented using an unpaired t-tests, otherwise noted. All tests were two-sided and the statistical significance was set at 0.05 .

Supplementary Figures

| Reagent | 4',6-Diamidino-2-phenylindole dihydrochloride (DAPI) | Sigma-Aldrich | Cat.\# D9542 |  |
| Chemical |  |  |  |  |
| Compound or Drug | Apamin | Sigma-Aldrich | Cat.\# A1289 |  |
| Genetic <br> Reagent | Lentivirus expressing <br> Rac1-shRNAs-green fluorescent protein | Genepharma <br> Technology Co., Ltd (Shanghai, China) | LV3(H1/GFP\&Puro) | The target shRNA regions were chosen as follows: Rac1-124, GCCAATGTTATGGTAGATGGA; |
|  |  |  |  | Rac1-219, <br> GCAAACAGACGTGTTCTTAAT; Rac1-340, |
|  |  |  |  | GGGACGAAGCTTGATCTTAGG; negative control, TTCTCCGAACGTGTCACGT. |
| Software; <br> Algorithm | Prism 8.1.2 software | Graphpad |  |  |
| Software; <br> Algorithm | Origin 9.0 | OriginLab |  |  |
