**Figure S1: tSNE plots color-coded for the expression of the additional marker genes from Figure 2e.**

Shown are the markers for cell clusters (related to Table S3): major histocompatibility complex (MHC), class II, DP beta 1 (HLA-DPB1); integral membrane protein 2C (ITM2C); immunoglobulin heavy constant gamma 2 (IGHG2); collecting duct cells: transmembrane protein 213 (TMEM213); ATPase H<sup>+</sup> transporting V1 subunit G3 (ATP6V1G3); ATPase H<sup>+</sup> transporting V0 subunit d2 (ATP6V0D2); distal tubule cells: defensin beta 1 (DEFB1); endothelial cell: plasmalemma vesicle associated protein (PLVAP); platelet and endothelial cell adhesion molecule 1 (PECAM1); protein tyrosine phosphatase receptor type B (PTPRB); glomerular parietal epithelial cells: CD24 molecule (CD24); keratin 8 (KRT8); mast cell: tryptase alpha/beta 1 (TPSAB1); cathepsin G (CTSG); carboxypeptidase A3 (CPA3); membrane spanning 4-domains A2 (MS4A2); hematopoietic prostaglandin D synthase (HPGDS); histidine decarboxylase (HDC); monocytes: CD14 molecule (CD14); nephron epithelial cells: protein tyrosine phosphatase receptor type O (PTPRO); and NKT cells: granulysin (GNLY); natural killer cell granule protein 7 (NKG7).

**Figure S2. NKT cell clusters of the CKTR**

Figure S2-Figure supplement 1. tSNE plot of 1074 NKT cells (from the CKTR), color-coded by their associated cluster (A) and the cell cycle status (B). CKTR: kidney allograft biopsy. (C) tSNE plot color-coded for expression (gray to white to red) of marker genes for CD4+ T cells, CD8+ T cells, CTLs, Tregs and NK cells. CTL: Cytotoxic T lymphocyte. (D) tSNE plot color-coded for the ssGSEA score for CD4+ T cells, CD8+ T cells, CTLs, Tregs and NK cells. ssGSEA: single-sample gene set enrichment. (E) Heatmap of the ssGSEA score, as estimated using gene sets from MsigDB, for five NKT cell clusters from CD4+ T cells, CD8+ T cells, CTLs, Tregs and NK cells. MsigDB: Molecular Signatures Database; (F) Violin plots showing the expression distribution of selected genes involved in metabolism, MHC-related, chemokine/cytolytic activity, negative

regulation of interleukin production and NK cell chemotaxis, stratified by NKT cell subpopulation.

### **Figure S3. B cell subclasses in kidney allograft biopsy samples**

Figure S3-Figure supplement 1. tSNE plot of 1121 B cells (from the CKTR), color-coded by their associated cluster (A) and the cell cycle status (B) and the score of the top 10 marker genes (C). CKTR: kidney allograft biopsy. (D) Heatmap of the ssGSEA score, as estimated using gene sets from MsigDB, for two B cell clusters for memory B cells from cluster 0 and memory B cells from cluster 4. MsigDB: Molecular Signatures Database; (E) tSNE plot color-coded for ssGSEA score of representative pathways for the clusters (clusters 0 and 4) are indicated. (F) Violin plots showing the expression distribution of selected genes involved in immune activation, stratified memory B cells (cluster 0) and memory B cells (cluster 4)

### **Figure S4. Monocyte subpopulations in kidney allograft biopsy samples**

Figure S4-Figure supplement 1. tSNE plot of 290 monocytes, color-coded by their associated cluster (A) and the cell cycle status (B). CKTR: kidney allograft biopsy. (C). tSNE plot color-coded for expression (gray to white to red) of marker genes for CD14+ monocytes (cluster 0), CD14+ monocytes (cluster 1), CD16+ monocytes (cluster 2), CD14+ monocytes (cluster 3) and myeloid dendritic cells (cluster 4). (D) Heatmap of the ssGSEA score, as estimated using gene sets from MsigDB, for three CD14+ monocyte (classical type) clusters from clusters 0, 1 and 3. (E) tSNE plot color-coded for ssGSEA score of representative pathways for the clusters (clusters 0 and 1) as indicated. (F) Violin plots showing the expression distribution of selected genes involved in immune activation, fatty acid metabolism and interleukin production, stratified CD14+ monocytes (cluster 0), CD14+ monocytes (cluster 1) and CD14+ monocytes (cluster 3). (G) Heatmap of the ssGSEA score, as estimated using gene sets from MsigDB, for two monocyte clusters from

classical (Clusters 0, 1, and 3) and nonclassical (cluster 2) monocytes. MsigDB: Molecular Signatures Database;

**Figure S5. Fibroblast clusters in kidney allograft biopsy samples**

Figure S5-Figure supplement 1. tSNE plot of 226 fibroblasts, color-coded by their associated cluster (A), the cell cycle status (B), and the score of top 10 marker genes (C). CKTR: kidney allograft biopsy. (D) tSNE plot color-coded for expression (gray to red) of marker genes for myofibroblasts (MyoFs). (E) Heatmap of the ssGSEA score, as estimated using gene sets from MsigDB, for three fibroblast clusters from clusters 0, 1 and 3. MsigDB: Molecular Signatures Database; (F) tSNE plot color-coded for ssGSEA score of representative pathways for the clusters (clusters 0, 1 and 2) as indicated. (G) Violin plots showing the expression distribution of selected genes involved in collagen and cell matrix adhesion, EMT/TGF- $\beta$ , and cellular biosynthesis, stratified by monocyte subpopulation. EMT: epithelial-to-mesenchymal transition

## **Supplementary Methods**

### **Chronic kidney transplantation rejection tissue processing and dissociation**

Two fresh chronic kidney transplantation rejection samples (Supplementary Table S1) were collected at the Zhujiang Hospital of Southern Medical University. First, fresh samples were taken from the operating room, placed in a solution containing Hank's balanced salt solution (HBSS; 311-512-CL) and 1% antibiotic-antimycotic (Gibco, 15240062) on ice, and transported to the laboratory within 20 min. Then, 0.5-1 g full-thickness sections of kidney tissue were cut lengthwise using surgical scissors. Subsequently, the tissue was washed twice with cold Dulbecco's phosphate-buffered saline (DPBS; WISENT, 311-425-CL). The tissue was placed on a stainless-steel cell filter, crushed with the plunger of a syringe and washed with DPBS. Flushing fluid was added to a centrifuge tube, and the kidney fragments were collected and placed in the tube, which was then spun at  $350 \times g$  for 5 min at 4 °C; this step was then repeated. After discarding the supernatant, TrypLE™ Express Enzyme (1X, Gibco, 12605010) was used to further digest the sticky clumps of cells for 5–10 min at 37 °C, and then the digestion was terminated using Dulbecco's modified Eagle's medium (DMEM; WISENT, 319-006-CL) containing 10% fetal bovine serum (FBS; Gibco, 10099141). The digested cells were centrifuged at  $350 \times g$  for 5 min at 4 °C. After discarding the supernatant, the cells were resuspended in 5 ml of DPBS and filtered through a 100 µm cell strainer. Next, red blood cells (RBCs) were removed using 1X RBC lysis buffer (10X diluted to 1X, BioLegend, B250015) for 5 min, and the cells were centrifuged at  $300 \times g$  for 5 min at 4 °C. After discarding the supernatant, the cells were suspended in DPBS and centrifuged again. The supernatant was again discarded, and the cells were resuspended in cold DPBS and passed through a 40 µm cell strainer. Live cells were counted using trypan blue staining (0.4%, Gibco, 420301). If the cell viability was above 90%, we performed 10x Genomics sample processing.

### **10x Genomics sample processing and cDNA library preparation.**

To prepare the single-cell suspension, the 10x Genomics Chromium Single Cell 3' Reagent Kit v3 user guide (<https://support.10xgenomics.com/single-cell-gene-expression/index/doc/user-guide-chromium-single-cell-3-reagent-kits-user-guide-v31-chemistry>) was followed. Single-cell samples were passed through a 40 µm cell strainer and counted using a hemocytometer with trypan blue. Then, the appropriate volume of each sample was diluted to recover 10,000 kidney cells. Subsequently, the single-cell suspension, gel beads and oils were added to the 10x Genomics single-cell A chip. We checked to ensure that there were no errors before running the assay. After droplet generation, samples were transferred into PCR tubes, and we performed reverse transcription using a thermal cycler (Bio-Rad). After reverse transcription, cDNA was recovered using a recovery agent provided by 10x Genomics, followed by silane DynaBead clean-up as outlined in the user guide. Before clean-up using SPRIselect beads, we amplified the cDNA for 10 cycles. The cDNA concentration was detected by a Qubit 4.0 fluorometer (Invitrogen). The kidney cDNA libraries were prepared according to the Chromium Single Cell 3' Reagent Kit v3.1 user guide.

### **Single-cell RNA-seq details and preliminary results**

Samples were sequenced by Hiseq Xten (Illumina, San Diego, CA, USA) with the following run parameters: read 1 for 150 cycles, read 2 for 150 cycles, and index for 14 cycles. Preliminary sequencing results (bcl files) were converted to FASTQ files with CellRanger (version 3.0, <https://support.10xgenomics.com/single-cell-gene-expression/software/pipelines/latest/what-is-cell-ranger>). We followed the 10x Genomics standard seq protocol by trimming the barcode and unique molecular identifier (UMI) end to 26 bp and the mRNA end to 98 bp. Then, the FASTQ files were aligned to the human genome reference sequence GRCh38. Subsequently, we applied CellRanger for preliminary data analysis and generated a file that contained a barcode table, a gene table and a

gene expression matrix. We carried out preliminary quality control (QC) on the FASTQ files to ensure high-quality scRNA-seq data. At the same time, using the website, we obtained some basic information, including the number of cells, the median number of detected genes, sequencing saturation and sequencing depth (Supplementary Table 2). The strategy of using CellRanger V3.0 and trimming the FASTQ data to 26 bp × 98 bp was used to preprocess the scRNA-seq data and perform downstream analysis.

### **Using Seurat R for quality control (QC) and data second analysis after mitigating the batch effect**

We used R (version 3.6.1, <https://www.r-project.org/>) and the Seurat[1,2] R package (version 3.6.1, <https://satijalab.org/seurat/>) for the analyses. We used the MergeSeurat function to merge the five kidney data sets (three GEO/healthy adult kidney samples; two chronic kidney rejection samples). The filter criteria of cells were determined after referencing previous studies[3,4]. According to the median number of genes and the percentage of mitochondrial genes in the kidney samples (Figure 1e), cells with <200 and >2,500 genes (potential cell duplets) and a mitochondrial gene percentage of >30% were filtered. After QC, 27197 high-quality kidney cells were obtained. The relationship between the percentage of mitochondrial genes and the mRNA reads was detected and visualized as the relationship between the number of mRNAs and the reads of mRNA (Figure 1c-d). After data normalization, all highly variable genes in single cells were identified after controlling for the relationship between the average expression and dispersion.

Since these data came from five different samples, to avoid the batch effect affecting the downstream analysis, we adopted a strategy called ‘Harmony’ to mitigate the batch effect. The R package Harmony focuses on the scalable integration of scRNA-seq data for batch correction and meta-analysis[5] (version 1.0, <https://github.com/immunogenomics/Harmony>). Subsequently, we used principal component analysis (PCA) with variable genes as the input and identified significant principal

components (PCs) based on the jackStraw function. Twenty PCs were selected as the input for uniform manifold approximation and projection (UMAP) and t-distributed stochastic neighbor embedding (tSNE) when statistically significant. We detected the batch effect between five different kidney samples (Figure 1g-h). With a resolution of 0.25, cells were clustered by the FindClusters function and classified into 15 different cell types (clusters 0-14). Next, we used the FindAllMarkers function to find differentially expressed genes (DEGs) between each type of cell (Supplementary Table S4).

### **Cell cycle analysis**

Cell cycle analysis was performed by using the Seurat program (CellCycleScoring function). We used a previously defined core set of 43 G1/S and 54 G2/M cell cycle genes[6]. Cells were classified by the maximal average expression ('cycle score') in these two gene sets. When the cycle scores of G1/S and G2/M were both less than 2, we considered these cells to be noncycling. Otherwise, we considered the cells to be proliferative. After the cell cycle analysis, no bias induced by cell cycle genes was observed (Figure 1i).

### **Cell type markers and subclustering analysis**

Cell type assignment was performed based on the marker genes reported in previous studies[7], the CellMaker database[8] and the R package 'SingleR'[9]. Subclustering analysis of NKT cells, monocytes, fibroblasts, and B cells was performed by using the SubsetData function in the Seurat program. We used the R package 'Harmony'[5] to mitigate the batch effect. After data normalization and scaling, all highly variable genes in single cells were identified after controlling for the relationship. Subsequently, twenty PCs were selected as the input for tSNE when statistically significant. The FindClusters function was used to classify cells into different clusters. Next, the FindAllMarkers function was used to find DEGs between each subtype. We adapted

the method reported by Mariathasan et al to calculate the score of the top 10 DEGs, which validated the clustering robustness. Next, to assign pathway activity estimates to individual cells, the R package GSVA[10] with the standard settings was implemented in ssGSEA, and a gene set containing all human pathways was downloaded from the MsigDB database[11] (KEGG, GO and Reactome). We identified significantly enriched pathways defined by the Benjamini–Hochberg-corrected P value  $< 0.05$ . To assess differential activities of pathways (GSVA) between sets of cells (for example, derived from chronic kidney rejection, normal samples or belonging to different subclusters), we contrasted the activity scores for each cell using a generalized linear model. To avoid inflating signals because of interindividual differences (for example, in the relative frequencies of cells from different patients), we always included the patient of origin as a categorical variable. The results of these linear models were visualized using bar plots or heatmaps. For the heatmaps, pathways or regulons that did not show significant changes (Benjamini–Hochberg-corrected P value  $> 0.05$ ) in any of the sets of cells contrasted in one analysis were not visualized. For the bar plot, pathways or regulons that did not show significant changes (Benjamini–Hochberg-corrected P value  $> 0.05$ ) were visualized in gray font.

## Statistics

For all experiments, samples from a single patient were processed in parallel, and cells for each sample of one patient were processed for scRNA-seq (10x Genomics) at the same time but in separate lanes and vials. Box plots were generated using the R base package and default parameters. Hence, the boxes span the interquartile range (IQR; from the 25th to the 75th percentiles), with the centerline corresponding to the median. Lower whiskers represent the data minimum or the 25th percentile minus  $1.5 \times \text{IQR}$ , whichever is greater. Upper whiskers represent the data maximum or the 75th percentile plus  $1.5 \times \text{IQR}$  (lower), whichever is lower. Given the number of

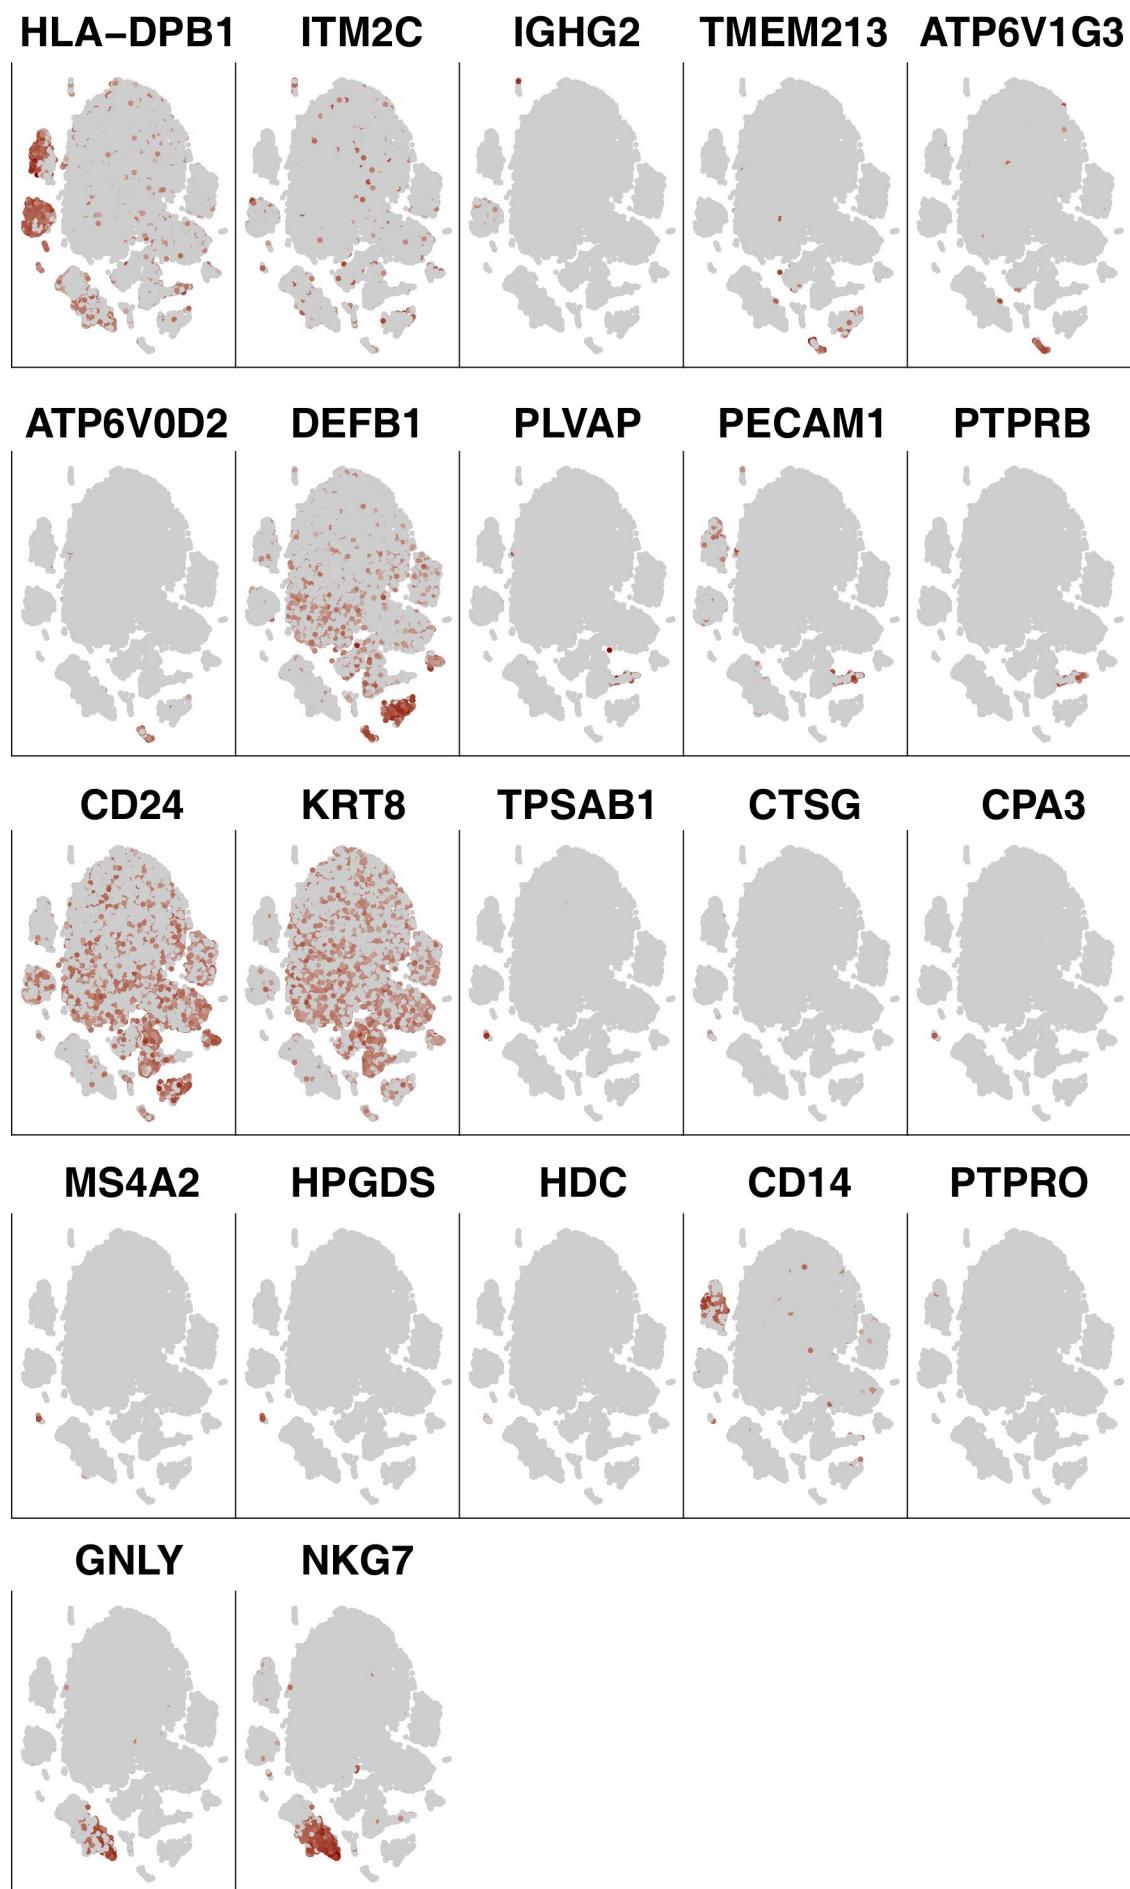

data points represented in the box and violin plots, we opted not to display each data point, as this would obscure the overall distribution. Comparisons between two groups were performed using an unpaired two-tailed t-test (R package limma[12]) or a Mann-Whitney U test. All statistical analyses and presentations were performed using R.
