

Supplementary Materials

Figure S1. The timeline of the experiments.

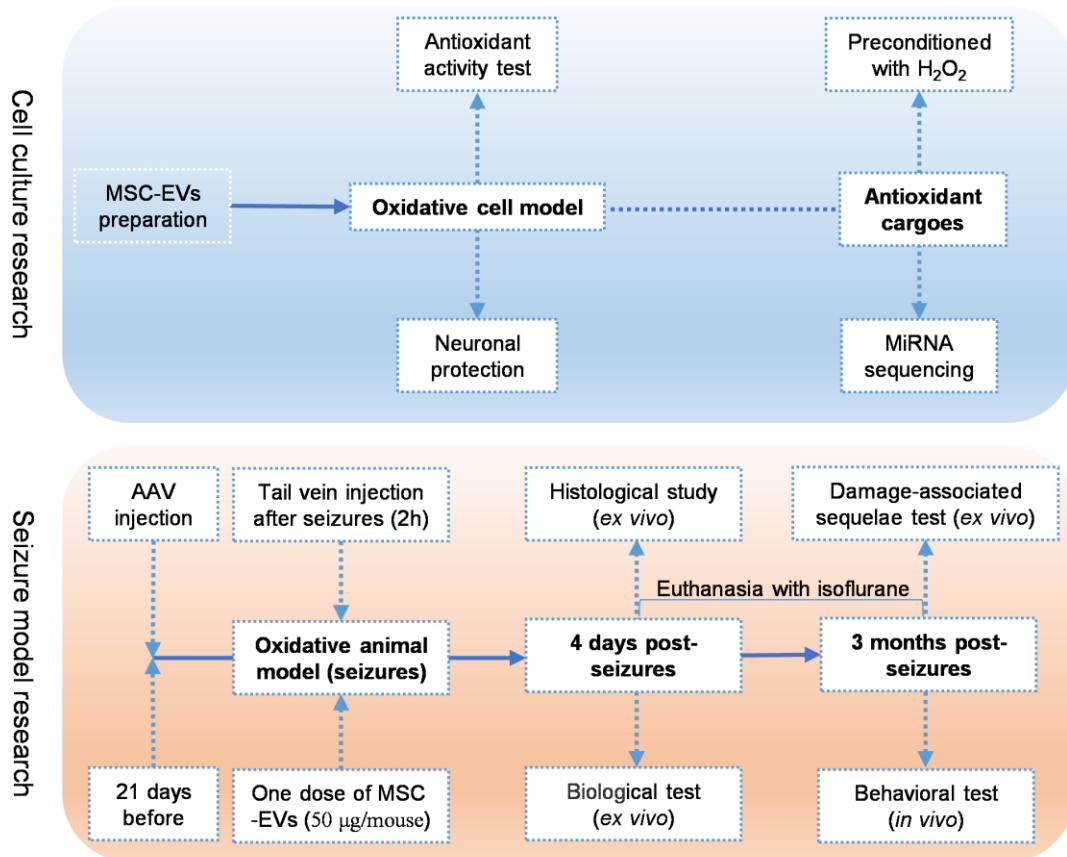

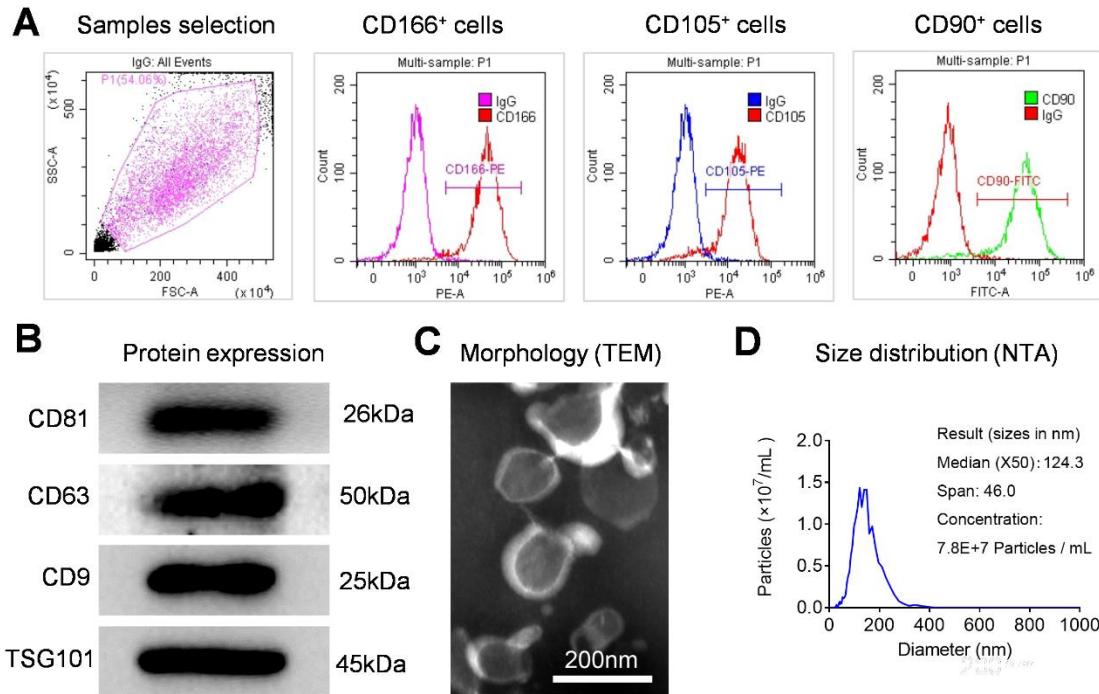

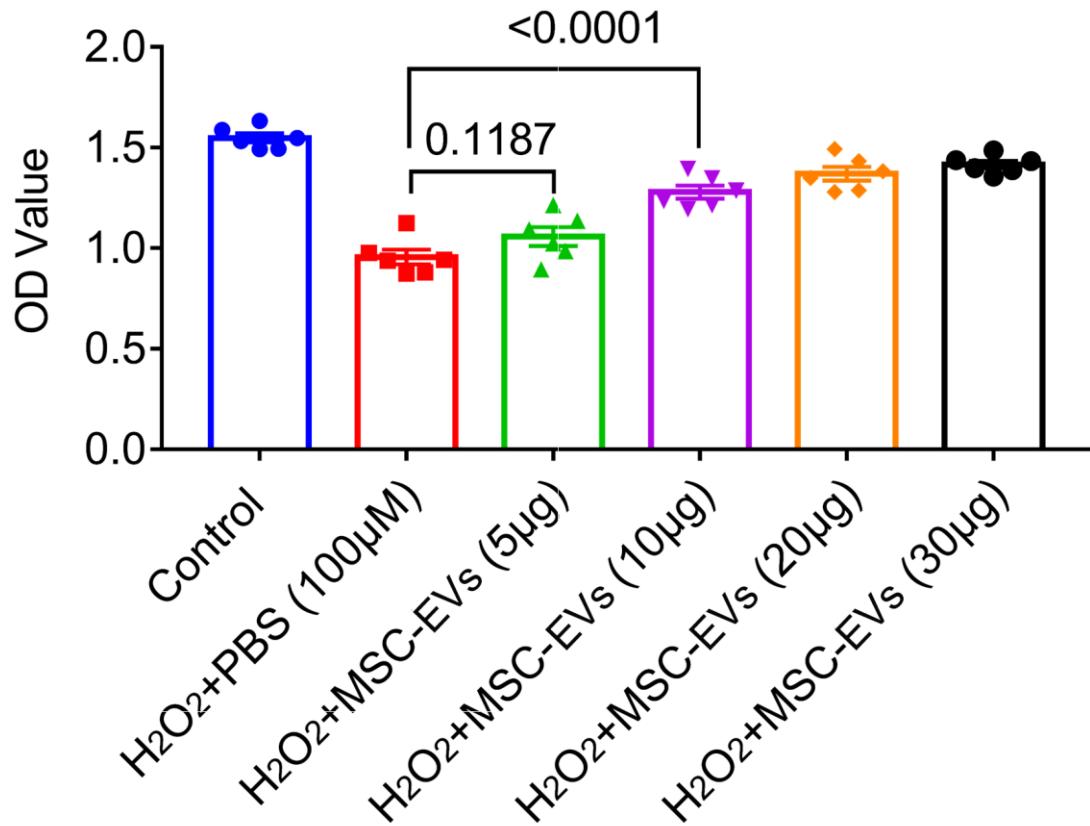

Figure S2. Characterization of MSCs and their derived EVs.

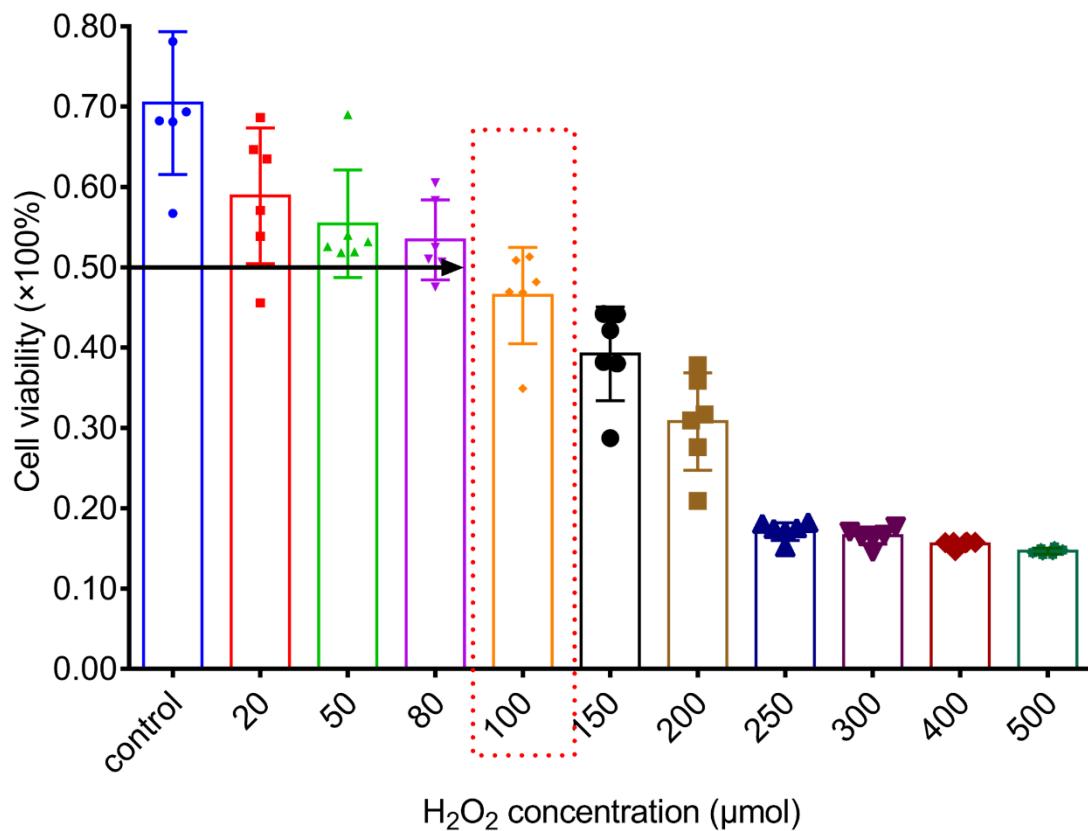

(A) Flow cytometry assay for the mesenchymal marker CD166, CD105 and CD90 in human umbilical cord MSCs. (B) Western blots of classical exosomal marker CD81, CD63, CD9, and TSG101 found on the surface of MSCs. (C) Transmission electron microscope (TEM) image of the exosomal morphology in MSC-EVs. (D) Nanoparticle tracking analysis (NTA) for the size distribution of MSC-EVs, median diameter shown 124.3 nm. Scale bar (C) = 200 nm.

Figure S3. Dose response of MSC-EVs on H₂O₂-stimulated hippocampal neurons.

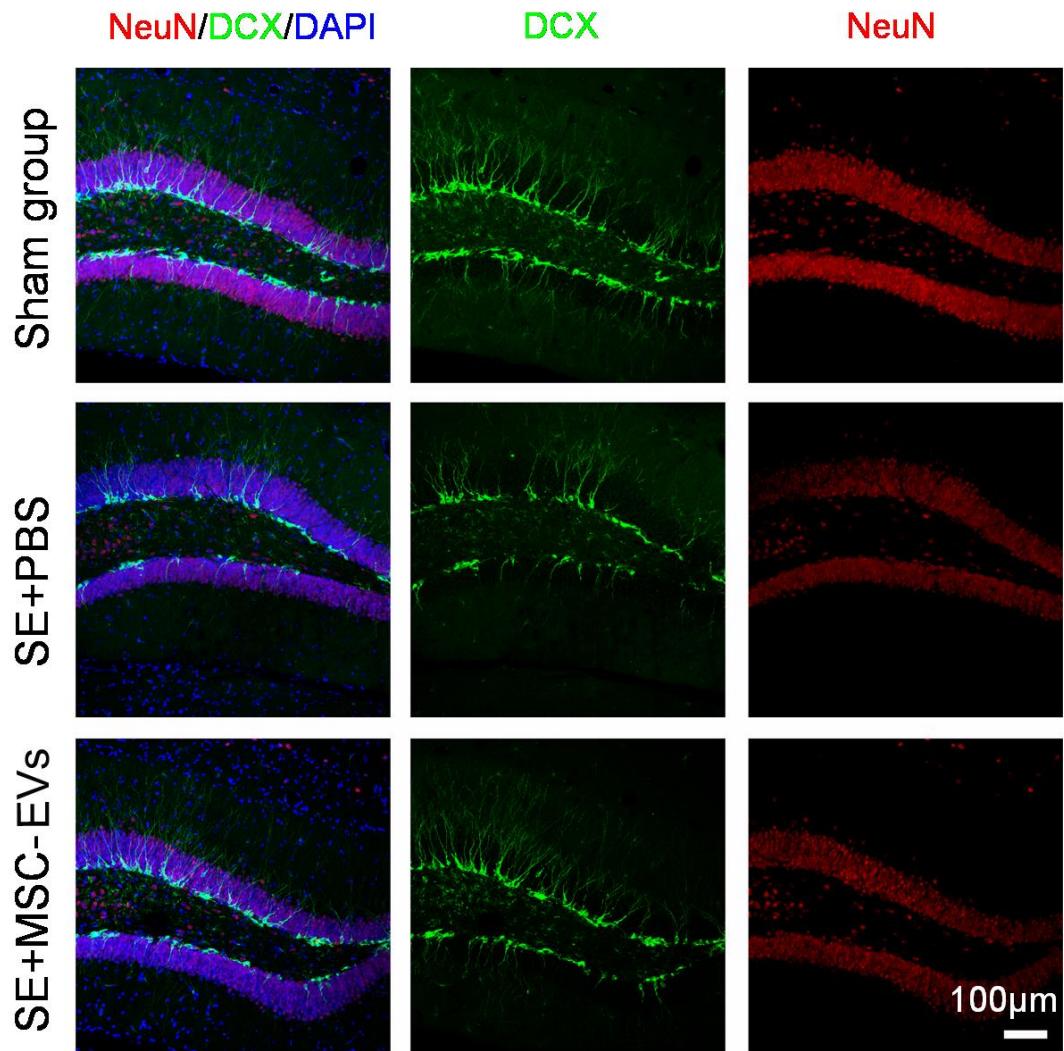

CCK-8 assay shows the cell viability in H₂O₂-stimulated primary culture of hippocampal neurons administered by different dose of MSC-EVs (n = 6 per group). Note a significant increase of optical density (OD) value in 10 μg/ml MSC-EVs treated group in comparison to H₂O₂+PBS group, *p* values were determined by one way-ANOVA.

Figure S4. Dose response of H₂O₂ on primary culture hippocampal neurons.

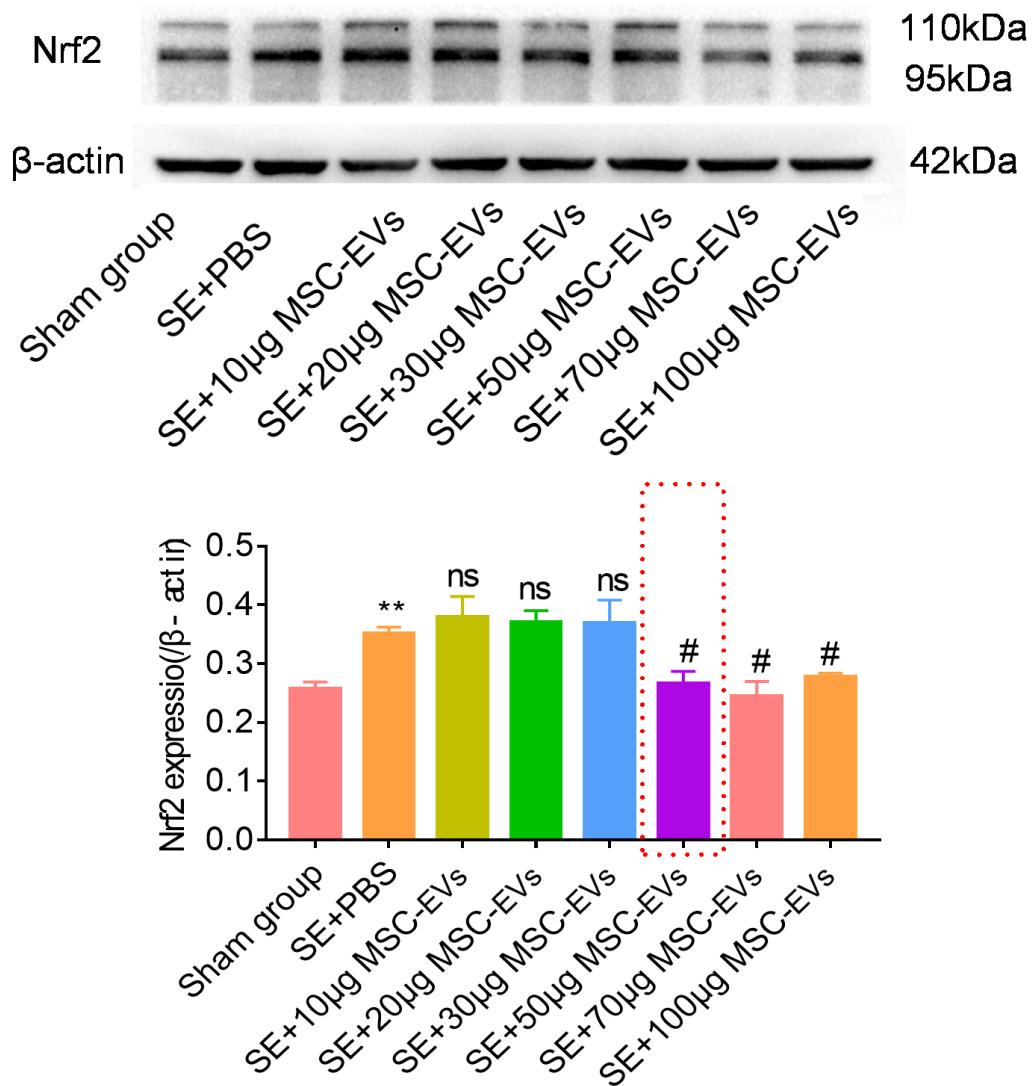

Histogram of different concentrations of H₂O₂-induced cytotoxicity on the primary culture of hippocampal neurons (n = 6 per group) at 3 hours, and the concentration (black arrow, 100 μmol) was used in this study according to the cell viability reduced 50 % in response to H₂O₂ stimulation.

Figure S5. Neurogenesis of hippocampal DG immunostaining for DCX and NeuN.

Immunostaining for hippocampal dentate gyrus (DG) by using doublecortin (DCX, a newborn neuronal marker) (green), NeuN (red) and 2-(4-Amidinophenyl)-6-indolecarbamidine dihydrochloride (DAPI) (blue), the representative images showed that, compared to Sham group, animals in SE+PBS group exhibited aberrant neurites (green) and decreased neurogenesis (Figure 7J) in the chronic phase, and MSC-EVs therapy (SE+MSC-EVs) displayed a pattern and extent of neurogenesis that was equivalent to Sham group and a greater extent of neurogenesis than animals in the SE+PBS group (Figure 7J). Scale bar = 100 μ m.

Figure S6. Antioxidant response of MSC-EVs on seizure-induced hippocampus.

(A) Different dose of MSC-EVs was used to treat seizure mice by tail vein injection, and Western blots of nuclear factor erythroid-derived 2, like 2 (Nrf2, a key antioxidant mediator) expression in hippocampus. (B) Histogram shows the dose response of MSC-EVs on seizure induced Nrf2 expression, the minimal effective concentration (50 µg MSC-EVs per mouse) was employed in this study. ns: no significance. ** $p < 0.01$ (vs. Sham group), ns $p > 0.05$ (vs. SE+PBS), # $p < 0.05$ (vs. SE+PBS).

Table S1. Antioxidant miRNAs in MSC-EVs

miRNA_ID	Log2 fold change	P value
hsa-miR-215-5p	6.534131	2.27E-05
hsa-miR-424-5p	6.103048	1.27E-09
hsa-miR-31-3p	6.000901	1.22E-15
hsa-miR-193b-3p	5.519835	5.38E-17
