Supplementary Information

Supplementary Figures

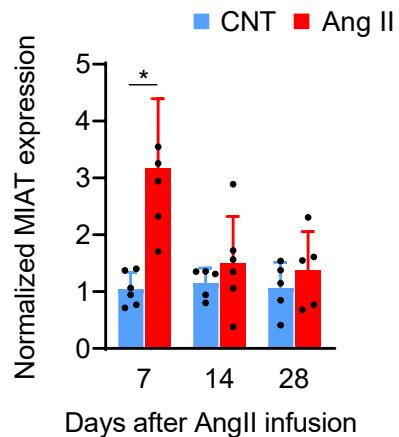

Figure S1. *Miat* expression is increased in the myocardium after Ang II infusion for 7 days. *Miat* expression was analyzed by qRT-PCR in the LV tissue of WT mice after saline (CNT) or Ang II (2 mg/kg BW/day) infusion via mini-osmotic pump for 7, 14 or 28 days. The expression levels were normalized to 18S, and expressed relative to the levels in the mice with saline treatment for 7 days. n = 5 per group. *p < 0.05 vs. CNT.

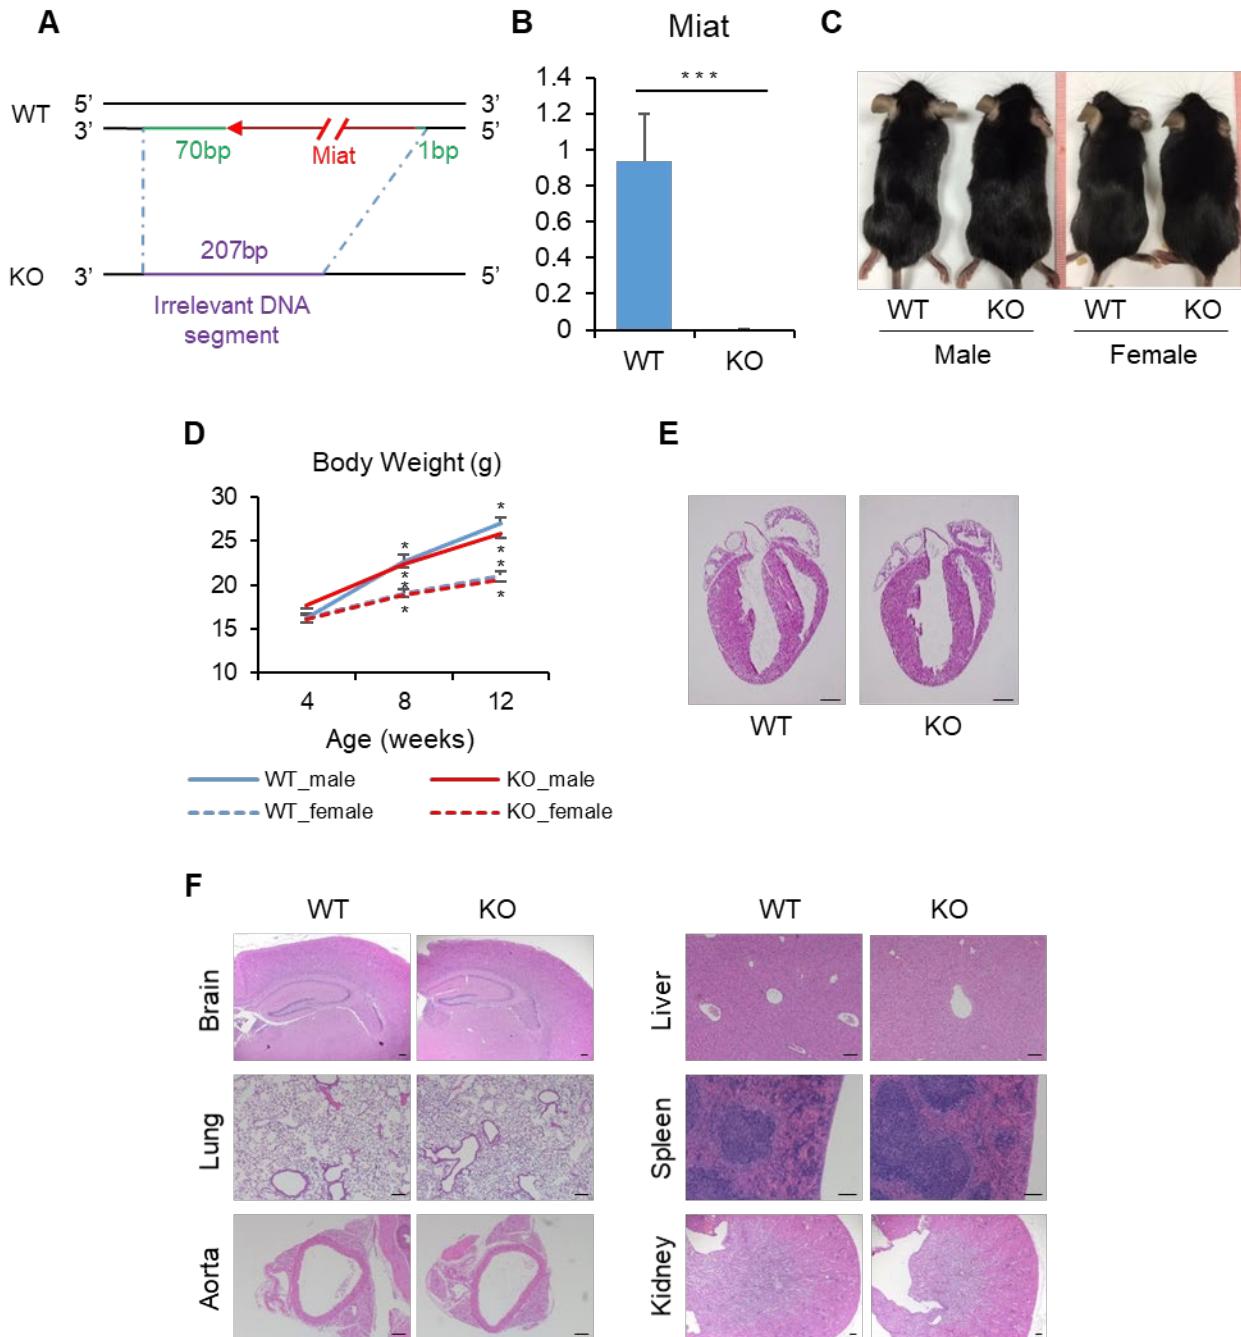

Figure S2. *Miat*-KO mice do not exhibit an obvious developmental defect. (A) Schema of genetic deletion of *Miat*. (B) qRT-PCR analysis of *Miat* in the heart of WT and *Miat*-KO mice, n = 4 per group. ***p < 0.001. (C-D) Gross examination (C) and body weight (D) of WT and *Miat*-KO mice, n = 10 per group. **p < 0.01, ***p < 0.001 vs. the level at Week 4. (E-F) Representative images for HE staining of hearts (E, scale bar = 1 mm) and other major organs (F, scale bar = 100 μ m) in WT and *Miat*-KO mice.

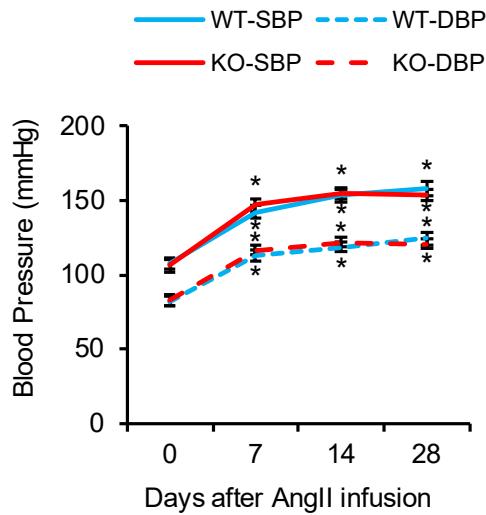

Figure S3. Ang II-induced hypertension is similar in WT and *Miat*-KO mice. Blood pressure of WT and KO mice at the indicated time points of Ang II treatment. SBP, systolic blood pressure. DBP, diastolic blood pressure. n = 11 per group. *p < 0.05 vs. Day 0.

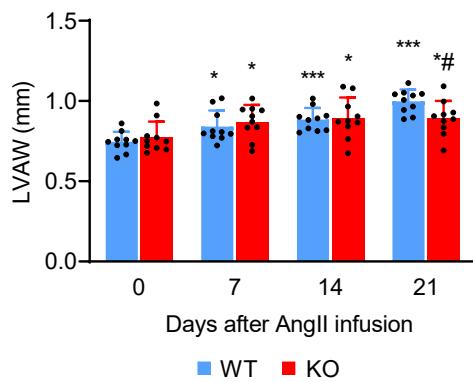

Figure S4. Ang II-induced LV wall thickening is attenuated in *Miat*-KO mice. *Miat*-KO mice and WT littermates were treated with Ang II (2 mg/Kg BW/day) via a subcutaneously-implanted mini-osmotic pump. The thicknesses of LV anterior wall (LVAW) were measured via echocardiography at the indicated time points after initiation of Ang II infusion. *p < 0.05, ***p < 0.001 vs. Day 0. #p < 0.05 vs. WT.

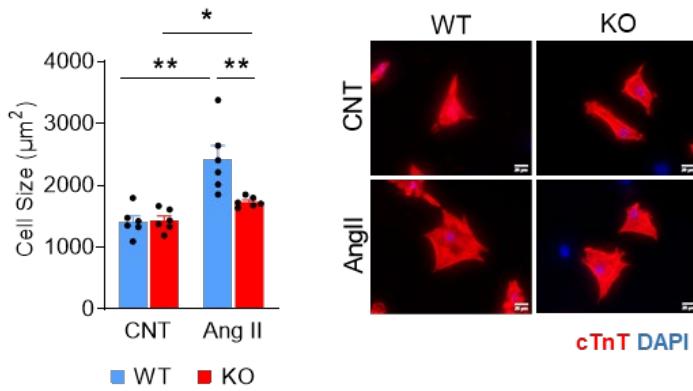

Figure S5. Deletion of *Miat* attenuates Ang II-induced hypertrophy of cardiomyocytes.
Cardiomyocytes were isolated from neonatal WT or *Miat*-KO mice and treated with Ang II (200 nM) or PBS (CNT) for 48 h, then stained with anti-cardiac troponin T (cTnT, red) and DAPI (blue). The area per cell was analyzed with NIH Image J and averaged. * $p < 0.05$, ** $p < 0.01$. Scale bar = 20 μm .

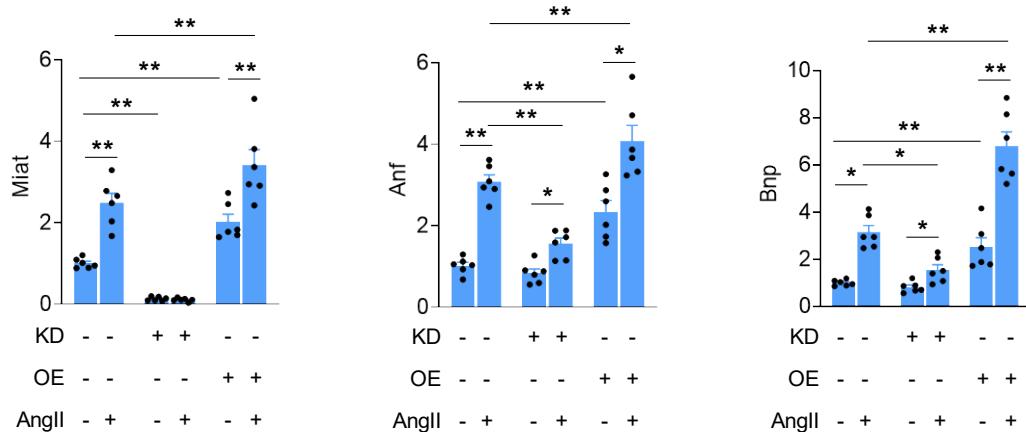

Figure S6. Knockdown (KD) of *Miat* attenuates, and overexpression (OE) of *Miat* aggravates, Ang II-induced hypertrophic gene program in HL-1 cells. HL-1 cells were infected with lentiviral vector coding for *Miat* shRNA (KD +) or control shRNA (KD -) and 72 h later, transfected with a plasmid coding for mouse *Miat* (OE +) or an empty plasmid (OE -). After overnight, the cells were treated with Ang II (200 nM, +) or PBS (-) for 24 h. The mRNA levels of *Miat*, *Anf* and *Bnp* were evaluated via qRT-PCR, normalized to 18S, and expressed relative to the values of KD (-) group. * $p < 0.05$, ** $p < 0.01$.

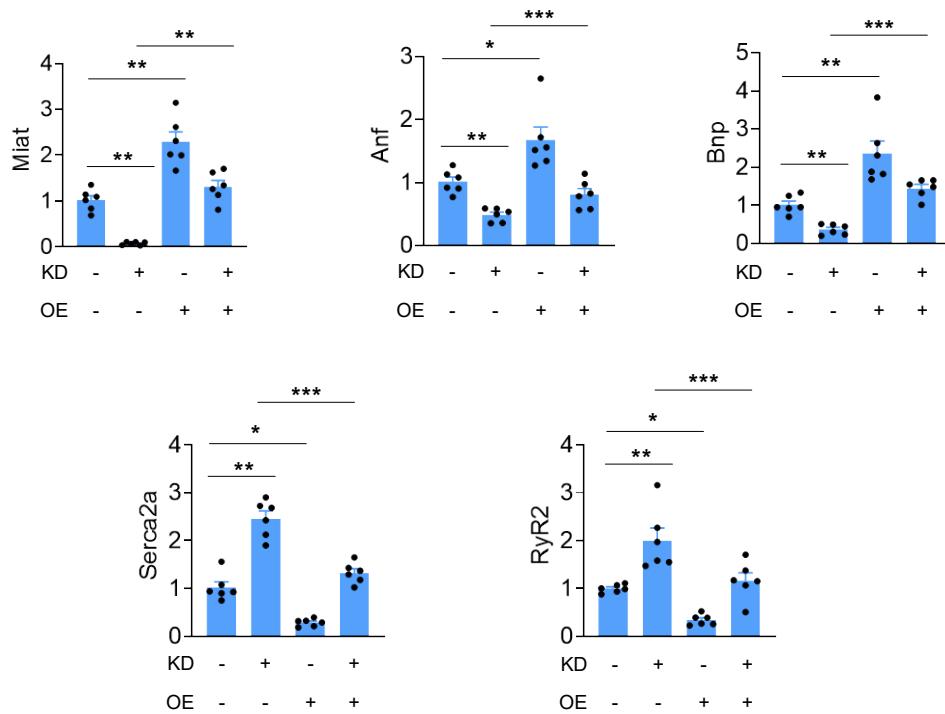

Figure S7. The attenuation of Ang II-induced hypertrophic gene program in *Miat*-KD HL-1 cells is reversed by *Miat* overexpression. HL-1 cells were infected with lentiviral vector coding for *Miat* shRNA (KD +) or control shRNA (KD -) and 72 h later, transfected with a plasmid coding for mouse *Miat* (OE +) or an empty plasmid (OE -). After overnight, the cells were treated with Ang II (200 nM) for 24 h. The mRNA levels of *Miat*, *Anf*, *Bnp*, *Serca2a* and *RyR2* were evaluated via qRT-PCR, normalized to 18S, and expressed relative to the values of KD (-) group. *p < 0.05, **p < 0.01, ***p < 0.001.

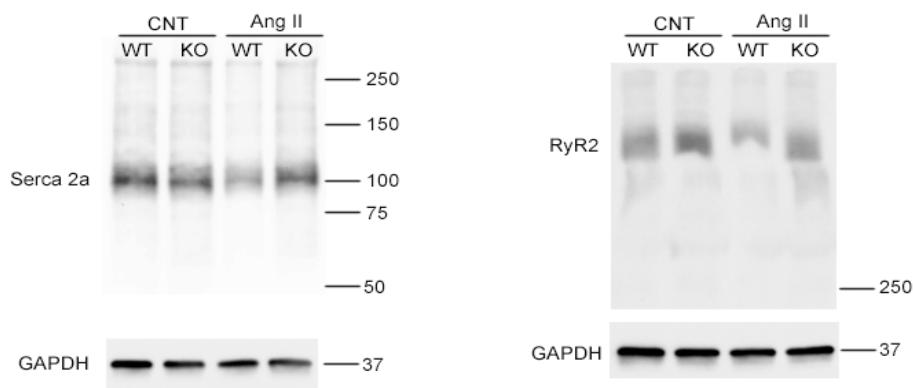

Figure S8. The original Western blots in Fig 5C.

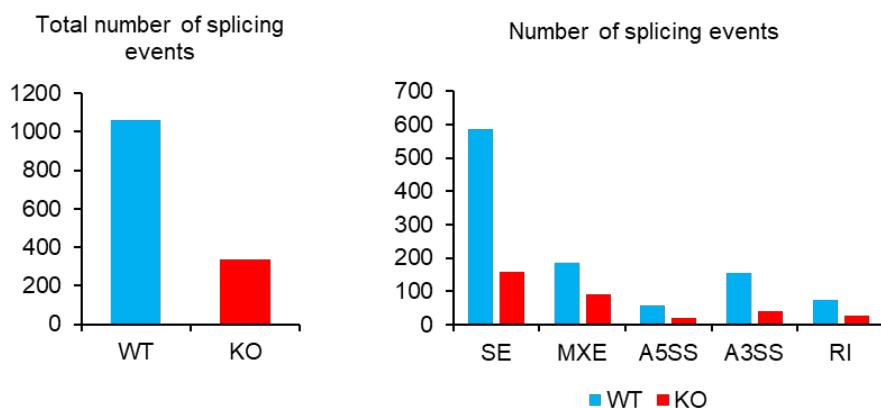

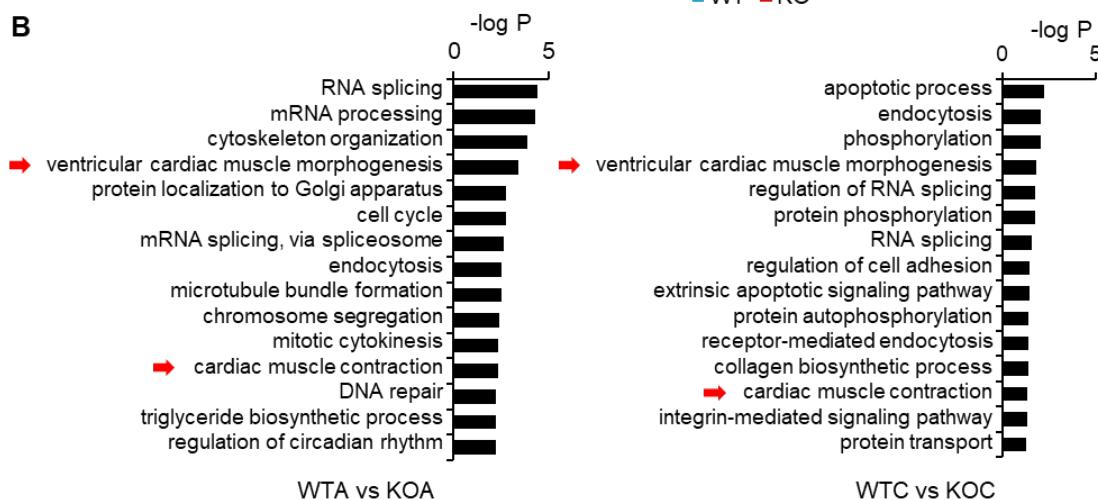

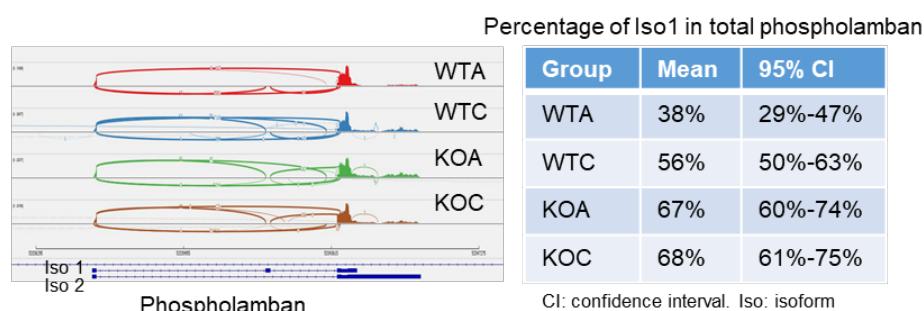

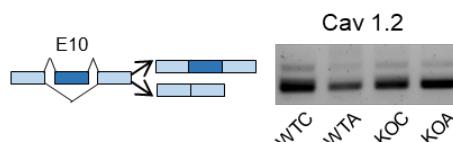

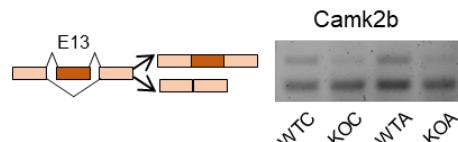

A**B****C****D****E**

Figure S9. Ang II-induced alternative splicing of cardiac genes is markedly attenuated in *Miat*-KO mice. Both WT and KO mice were treated with Ang II (WTA, KOA) or saline (WTC,

KOC) via mini-pump for 7 days. Then RNAs were isolated from left ventricles and sequenced. (A) Total number of splicing events. SE, skipped exon; MXE, mutually exclusive exons; A5SS, alternative 5' splice site; A3SS, alternative 3' splice site; RI, retained intron. (B) Top 15 biological processes in GO analyses of genes with significant alternative splicing events. (C) Phospholamban isoform constitution. (D-E) Semiquantitative RT-PCR analysis showing splicing alterations of Cav 1.2 (D) and Camk2b (E).

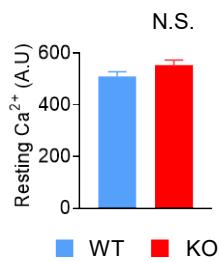

Figure S10. Deletion of *Miat* does not change resting calcium concentration in cardiomyocytes. Cardiomyocytes were isolated from adult WT and *Miat*-KO mice, and resting intracellular Ca²⁺ levels (F0), n = 140 for WT, n = 114 for KO. N.S., not significant vs. WT.
